

AI-powered documentation quality scoring tool: social media post sample

Document type: Social media post

Audience: Hiring managers, content leads, and technical writing teams

Purpose: This sample shows how I explain a technical content tooling project in a concise, public-facing format.

Note: This is a portfolio writing sample based on an internal documentation tooling project.

AI has made it easier for teams to create more documentation.

It has also made it harder to keep that documentation accurate, consistent, and useful.

Documentation often draws from many teams: product managers, engineers, solutions architects, support engineers, and technical writers. That means more drafts, more source material to check, and more chances for small issues to slip through.

I kept seeing the same pattern in review, so I built an AI-powered documentation quality scoring tool while working as a technical writer at Amazon.

I first built it as a VS Code extension for Markdown drafts. Each document received a score out of 5, along with the issues behind the score.

The score combined writing quality with technical accuracy: unclear structure, long sentences, inconsistent terms, missing context, and claims that seemed to conflict with approved source material.

Because cost mattered, I used Claude Sonnet selectively and reserved AI review for the checks where it added the most value.

The point was not to replace peer review. It was to give reviewers a better starting point. I tested the scores against documents I had already reviewed by hand, then adjusted the scoring until the feedback matched the main issues I would expect a strong reviewer to catch.

Later, I added a CLI version.

That changed the tool from something I used on individual Markdown drafts into something teams could use to assess documentation at a larger scale. It could batch score web pages and Word documents, giving writers and non-writers a faster way to understand the quality of existing docs.

The larger value was that documentation quality became easier to see. Instead of relying only on late-stage review or one person's judgment, teams had a faster way to spot weak docs, compare quality across formats, and decide what to fix first.

Why this sample matters

This sample shows how I turn a technical tooling project into concise, audience-aware content. It explains the problem, design choices, and workflow value without relying on proprietary implementation details.
